

Git - workflow

First setup git

- Install Git in your local computer
- Create a GitHub Account
- Configure Git (First Time Setup) (They only set your **identity for commits.**)

❏ Bash

```
git config --global user.name "Your Name"
git config --global user.email "your@email.com"
```

See more details on how to [set up GIT](#).

Initialize git in your project

`git init` is a Git command used to initialize a new Git repository in your current project folder.

❏ Bash

```
git init
```

What it does:

- Creates a hidden `.git` folder inside your project
 - Starts version control tracking for the project
 - Allows you to use Git commands like `git add`, `git commit`, and `git push`
-

When working with your project

1. **Create new branch based on branch main:** *Make sure you are in branch main and the branch main up to date*
2. **Create new branch and checkout to that new branch**
3. **Then make changes your codes in the project**
4. **Add the changes**
5. **Commit your changes**
6. **Push your code to remote repository**
7. **Create pull request and submit to reviewer if you are ready**

1. Create new branch based on branch main

Make sure you are in branch main and the branch main up to date

- If you don't stay on main yet, switch to branch main:
 - **git checkout main**
 - Make sure your "main" branch up to date:
 - **git pull - - rebase origin main**
2. **Create new branch and checkout to that new branch**
 - **git checkout -b {new-branch}**
 3. **Then make changes your codes in the project**
 4. **Add the changes, either one of the following:**
 - **Add all files**
 - **git add .**
 - **Add specific files**
 - **git add {specific-file}**
 5. **Commit your changes**, either do one of the following:
 - **git commit**
 - **git commit -m "Commit message here"**
 6. **Push your code to remote repository:**
 - **git push origin {branchName}**
 7. If you are ready, **create pull request and submit to reviewer**
-

Case you want to make changes to the pull request

- Make sure you stay on the correct branch
- Make changes in your codes
- Add the changes to your code in the project
 - **git add .**
 - **or git add {specific-file}**
- Amend to your previous commit, either do one of following
 - **git commit --amend --no-edit** (when don't want to change message)
- Push your code to remote repository:
 - **git push origin {branchName} -f**
- You can check your changes to your current pull request
